

LegalEase AI

Brainstorming & Ideation Phase

Institution: Shri Krishnaswamy College for Women, Anna Nagar, Chennai - 600040

Team ID: SWTID-2026-5175

Team Leader: Srinithi.P

Team Member: Varshini.S

1. INTRODUCTION

LegalEase AI is an AI-powered legal assistance platform designed to make general legal information easier to understand and access. Legal documents and legal terminology can often be difficult for ordinary users because they contain complex words and lengthy explanations.

The main idea of LegalEase AI is to use Artificial Intelligence and Large Language Models (LLMs) to simplify legal information and provide easy-to-understand responses. The application can accept a user's general legal question or legal-related content and process it using an AI model.

The brainstorming phase focuses on identifying the main problem, understanding the needs of users, proposing an AI-based solution, and defining the basic features and workflow of the application.

2. OBJECTIVES

The main objectives identified during the Brainstorming and Ideation Phase are:

- Identify the difficulty users face while understanding legal information.
- Identify the need for simple and accessible legal explanations.
- Propose an AI-assisted solution for general legal information.
- Identify the main user inputs and expected outputs.
- Plan AI-based question answering and legal document summarization.
- Define a simple and user-friendly application workflow.
- Identify suitable AI/LLM technologies for the project.

3. PROBLEM IDENTIFICATION

During the brainstorming stage, the following key challenges were identified:

- **Complex Terminology:** Legal terminology is often difficult for ordinary users.
- **Verbose Documents:** Legal documents contain lengthy and complicated information.
- **Lack of Understanding:** Users may not understand the meaning of specific legal terms.
- **Access Barriers:** Finding simple explanations for general legal questions can be difficult.
- **Digital Platform Need:** Users need a simple digital platform to access general legal information.

4. PROPOSED SOLUTION

The proposed solution is to develop an AI-powered platform that can process general legal questions and provide simplified information.

Basic Concept Flow:

User Question → Backend → AI / LLM → Processed Response → User

The user enters a general legal question through the application. The backend receives the input and sends it to the AI/LLM system. The AI processes the question and generates a response in simple language.

Note: The system is intended for general informational assistance and not as a replacement for professional legal advice.

5. PHASE WORKFLOW

6. DETAILED EXPLANATION

The Brainstorming and Ideation Phase defines the basic concept of LegalEase AI before actual implementation begins.

First Step: Understand the user's problem. Since legal information can be difficult to understand, the project focuses on making general legal information simpler.

Second Step: Identify possible AI-based solutions. Artificial Intelligence can be used to understand user questions, process legal-related content, summarize information, and generate simple explanations.

Third Step: Identify the expected user interaction. The user should be able to enter a question and receive an understandable response without navigating through complicated steps.

7. BASIC CODE / IMPLEMENTATION CONCEPT

The following Python code represents the basic concept identified during the ideation stage:

```
def legal_assistance(user_question):
    prompt = f"""
    You are LegalEase AI,
    an AI legal information assistant.

    Explain the following general legal question
    in simple and understandable language.

    User Question:
    {user_question}

    Provide general informational assistance only.
    """
    return prompt

question = input("Enter your legal question: ")
response = legal_assistance(question)

print("\nLegalEase AI:")
print(response)
```

Code Explanation:

- `legal_assistance()`: This function represents the main legal assistance component.
- `user_question`: This variable stores the question entered by the user.
- `prompt`: The prompt provides instructions to the AI about how the legal question should be processed.
- `input()`: The `input()` function allows the user to enter a legal question.
- `print()`: The `print()` function displays the generated response or processing prompt.

In the complete LegalEase AI application, this basic concept can be connected with the backend and an AI/LLM API to generate actual AI-based responses.

8. EXAMPLE USER INPUT AND OUTPUT

EXAMPLE SCENARIO

User Input: What is a rental agreement?

Expected AI Response:

"A rental agreement is an agreement between a landlord and a tenant. It generally contains details such as rent, rental period, responsibilities, and other agreed conditions."

This demonstrates how the system can convert a general legal concept into simpler information.

9. EXPECTED OUTCOME

At the end of the Brainstorming and Ideation Phase, expected outcomes include:

- A clearly identified legal-information problem.
- A proposed AI-based solution.
- Identified user inputs and outputs.
- Planned AI-based question answering and legal document summarization functionality.
- A basic application workflow.
- Identification of AI/LLM integration requirements.

10. PHASE CONCLUSION

The Brainstorming and Ideation Phase provides the initial foundation for the development of LegalEase AI. During this phase, the major difficulties in understanding general legal information were identified and an AI-based solution was proposed.

The phase helped define the purpose, objectives, basic workflow, expected features, and AI integration concept of the project. By using Artificial Intelligence and Large Language Models, LegalEase AI aims to make general legal information easier to understand through a simple and user-friendly platform.

This phase provides a structured foundation for the next stage of the project, where the identified requirements and ideas can be analyzed and converted into a practical system.
